Welcome to tmux!

tmux is a terminal multiplexer: it enables a number of terminals to be created, accessed, and controlled from a single screen. tmux may be detached from a screen and continue running in the background, then later reattached.

This release runs on OpenBSD, FreeBSD, NetBSD, Linux, macOS and Solaris.

Dependencies

tmux depends on [libevent](#) 2.x, available from [this page](#).

It also depends on [ncurses](#), available from [this page](#).

To build tmux, a C compiler (for example gcc or clang), make, pkg-config and a suitable yacc (yacc or bison) are needed.

🔗 Installation

🔗 Binary packages

Some platforms provide binary packages for tmux, although these are sometimes out of date. Examples are listed on [this page](#).

🔗 From release tarball

To build and install tmux from a release tarball, use:

```
./configure && make  
sudo make install
```

tmux can use the utempter library to update utmp(5), if it is installed - run configure with `--enable-utempter` to enable this.

For more detailed instructions on building and installing tmux, see [this page](#).

🔗 From version control

To get and build the latest from version control - note that this requires `autoconf`, `automake` and `pkg-config`:

```
git clone https://github.com/tmux/tmux.git  
cd tmux  
sh autogen.sh  
./configure && make
```

🔗 Contributing

Bug reports, feature suggestions and especially code contributions are most welcome. Please send by email to:

tmux-users@googlegroups.com

Or open a GitHub issue or pull request. **Please read [this document](#) before opening an issue.**

There is [a list of suggestions for contributions](#). Please feel free to ask on the mailing list if you're thinking of working on something or need further information.

🔗 Documentation

For documentation on using tmux, see the tmux.1 manpage. View it from the source tree with:

```
nroff -mdoc tmux.1 | less
```

A small example configuration is in `example_tmux.conf`.

And a bash(1) completion file at:

<https://github.com/scop/bash-completion/blob/main/completions-core/tmux.bash>

For debugging, run tmux with `-v` or `-vv` to generate server and client log files in the current directory.

Support

The tmux mailing list for general discussion and bug reports is:

<https://groups.google.com/forum/#!forum/tmux-users>

Subscribe by sending an email to:

tmux-users+subscribe@googlegroups.com
